Perennity Universal Portal PLUS

Lightweight Patient Viewer

Secure:

It is classified as Class Level "A" by leading forensic platforms (inmuniweb.com, segurityheaders.com, etc.) that monitor and diagnose security. This guarantees that the studies delivered are private, cannot be intercepted. Portal acts as a secure "barrier" between "outside" users and the "inside" PACS.

Spanish/English switchable:

The portal can be operated in the language of your choice, either Spanish or English.

Easy to access:

The portal allows the patient to access their studies with a single click and not depend solely on email, since not all people have computer skills. The patient and the doctor can receive their study results, in addition to Email, by other means such as SMS, WhatsApp Business or QR Code.

Compatible with any type of device:

Be it PC, smartphone or tablet.

Light and precise viewer:

It includes a viewer that opens the studies quickly and immediately and that does not overload the device of the patient or the referring doctor.

Flexible:

The patient can access their radiological studies in different ways: view them directly on the portal or download them in DICOM format, DICOM with viewer, or JPEG on any device (computer hard drive, USB or CD/DVD).

In addition, the patient can share their studies with anyone they want, either by Email or WhatsApp.

Support, maintenance and updates:

Permanent, from the moment of installation and on a day-to-day basis.

Easy to implement:

It has connectivity tools to install immediately in any environment that the institution has.

Unified delivery:

As the Portal also allows the delivery of laboratory reports, in the case of those diagnostic clinics that offer both services, it is possible to unify all the patient's studies and their laboratory reports in a single shipment and unify their history.

Connect and combine the studies of different sites:

This is possible through routers (software) that are installed on a server or a PC at each site.

Customizable images, logos, policies, etc.

The institution can use its domain or subdomain to provide access to the portal. In addition, they can use the image of the institution of their choice, their logo and address. Additionally, they can customize their privacy policies, disclaimer, etc.

Automated delivery:

It can connect with the PACS or the modalities to load the studies and also automatically obtain the data of the patient and referring doctor from any source that is indicated to send the results without the need for human intervention.

Delivery by operator:

An operator can send the results by typing the patient's email address and phone number and selecting the delivery method: SMS, WhatsApp or QR Code.

NO major investment to start:

The most attractive thing is that the Portal service is charged through a based on actual annual usage. The charge is made per study uploaded to the portal regardless of the size of the study, that is, it can have multiple images plus the corresponding interpretation and diagnosis report.

Universal Multi-Portal Hosting option

This is a solution to provide small lower volume users an independent customized portal under a "Master" Universal Portal platform. This is ideal for local or cloud datacenters. Contact the Perennity PLUS customization team for further information.
